Third-stage larvae, L3, were isolated from infected black flies in Cameroon (forest strain). The L3 were cultured in 20% FCS in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of 0. volvulus molt to fourth stage larvae by day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 1026 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Lizotte-Waniewski in the Laboratory of Dr. S. A. Williams. The Library is available from Dr. Sara Lustigman (email: slustigm@nybc.org)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 1026 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Lizotte Waniewski in the Laboratory of Dr. S. A. Williams. The library is available from Dr. Sara Lustigman (email: slustigm@nybc.org)."

Claim 4; Page 18; 28pp; English.

Chaim 4; Page 18; 28pp; English.

The sequence was deduced from a CDNA insert from pAE-III-202-4

(FERM BP-3172). The vector serves as a source for a DNA fragment encoding PHL for the construction of an expression vector for the prepn. of recombinant PHL. The protein may be truncated to comprise only residues 383-706 or 383-713. The PHL catalyses the reaction: R-GlyOH -> R-NH2. It can be used to produce peptides with amidated C-termini, e.g. calcitonin, growth hormone, LH-RH.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              seq_name: A_Geneseq_36:p81184
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc of the peplomeric gene in three reading frames. The top reading cc frame is an open reading frame of 4356 nucleotides and has a coding cc capacity for a precursor polypeptide having a mol. wt. of 160,470 cc (1452 AAS). The beginning and the end of the E2 gene are indicated comparison to the FT of N81533. The first 18 N-terminal AAS have a strong comparison to the FT of strong and the end of the E2 gene are indicated comparison. The extreme carboxy-terminal part comprises a region of 20 cpeptide. The extreme carboxy-terminal part comprises a region of 20 cpeptide. The extreme carboxy-terminal part comprises a region of 20 cpeptide. The extreme carboxy-terminal part comprises a region of 20 composition of the N-terminal part (pos. 1-790) which corresponds comparison to the N-terminal part (pos. 1-790) which corresponds to the S-part of the IBV E2 (see p81183). N.B. IBV = infectious of a stop carbon.

Cc common of the IBV E2 (see p81183). N.B. IBV = infectious contains virus. "x" in the AA sequence denotes the translation confidence of a stop carbon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          alignment_block:

Bovine biglycan (R87953) is a chondroitin sulphate proteoglycan with Bovine biglycan (R87953) is a chondroitin sulphate proteoglycan with Bovine biglycan (R87953) is a chondroitin sulphate proteoglycan and remarked in the structure and function of CNS neurons the survival and maintain the structure and function of current ageing as well as after pathological and/or traumatic during normal ageing as well as after pathological and/or traumatic nervous system damage. It can also be used to restore function following nervous system lesions and degenerative diseases, and to improve learning efficiency and memory in the elderly and in patients with Jamanaria

Human biglycan (R87952) is a chondroitin sulphate proteoglycan with neurotrophic activity for brain neurons. It can be used to enhance the survival and maintain the structure and function of CNS neurons during normal ageing as well as after pathological and/or traumatic nervous system damage. It can also be used to restore function following nervous system lesions and degenerative diseases, and to improve learning efficiency and memory in the elderly and in patient with Ammentia

Disclosure; 7pp; English.

Plasmid pAx799 contains a sequence derived from Xenopus laevis. The plasmid was screened from an E.coli library using plasmid pXA457 to screen a larger library.

Although the gene product is similar to that of pXA457 at the N-terminus, it has an area of hydrophobic elements suggesting a membrane function. See also N93060.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (SUNR) Suntory Ltd.

Increasing protein prodn. from cultured animal cells - by adding Increasing protein prodn. from cultured animal cells - by adding a trichostatin to the medium, effective at low concn. and not injurious to host cells

Disclosure; Page 10-15; 19pp; English.

3mu-15 cells (i.e. CHO cells expressing a peptidyl C-terminal alpha-amidase enzyme (AE)) were suspended in F-12 medium to which aliquots of trichostatin were added. Cells were cultured for 3 days at 37 deg and then assayed for AE. Without trichostatin, AE productivity was 708 U/ml. At 10, 50, 100 and 200 nM trichostatin, AE productivities were respectively 866, 1897, 1894 and 3359 U/ml.

SRB8 and SRB9 appear to repress C-terminal domain (CTD) function. SRB8 and SRB9 appear to repress CTD activity. Genomic clones (T59904-11) for the SRBs have been obtd. SRBs can be used to treat diseases resulting from alteration or SRBs can be used in in vitro transcription of DNA and to identify can also be used in in vitro transcription.

The DNA sequence (T34137) which encodes the biosynthetic enzymes of icosapentaenoic acid (EPA) can be used to transform Escherichia coll The DNA sequence allows efficient microbial production of EPA, which is a raw material for drugs, agrochemicals, foods and animal feedstuffs. EPA is also useful for lipid balance correction and as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human bone matrix DNA and proteins used in detection, diagnosis and treatment involving skeletal and/or connective tissue disease states.

and/or connective tissue disease states.

pisclosure; p; English.

probes and Abs raised to the proteins can be used to determine probes and Abs raised to the proteins can be used to determine their levels useful in diagnosis of associated conective tissue their levels useful in diagnosis of sosteo/rheumatoid arthritis, diseases states such as osteoporosis, osteo/rheumatoid arthritis, paget's disease, artherosclerosis and periodontal disease.

Proteins may also be used to induce or block biological function. Sequence 368 AA;

The FIPV-I spike protein may be used in the production of a vaccine for the prevention and treatment of FIPV-I infection. The spike protein may be produced by transforming a host cell with the spike protein DNA and expressing the sequence such that the spike protein can be isolated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       789

probable membrane protein YMR216c - yeast (Saccharomyces cerevisiae)
N.Alternate names: hypothetical protein YM8261.10c
C;Species: Saccharomyces cerevisiae
C;Date: 08-Jul-1995 #sequence_revision 01-Sep-1995 #text_change 06-Feb-1998
C;Accession: S55098
C;Accession: S55098
C;Rocedman, K.; Brown, D.; Bowman, S.
                                                                                                         R; Dedman, K; Brown, D.; Bowman, S.
submitted to the EMBL Data Library, June 1995
symbolited to the EMBL Data Library, June 1995
